

1. I used Java documentation to brush up my knowledge on arrays  
<https://docs.oracle.com/javase/tutorial/java/nutsandbolts/arrays.html>

2. I used array in my code to store the data for each of the three types of candles, I also used `String.format("%.0f", #)` to only print 2 decimal and round to the nearest
3. Based on the test I did from the provided scenario seems that my code work as expected.
4. It was fun project as it reminded me of a previous project that I worked on in a previous Java class that was transferred as 1213 in UNCC
5. It was really a learning project where I was able to revisit arrays to implement them in this project as I will be not taking 1213 so it is really a good practice for me so I can get feedback now and get to relearn them in the next few weeks when we will cover them in class.
